

PID 3SIXTY: Your ecosystem for product identification

A new world of possibilities

Welcome to PID 3SIXTY

Manage print jobs and data for your whole product identification process as easy and effortless as ever before!
State-of-the-art, user-centric, and future-proof: As an out-of-the-box software solution, PID 3SIXTY takes care 360 degrees around your individual product identification process.

The innovative software suite is able to control the entire product identification process – ensuring that product data out of your data-base (e.g. ERP system) is transformed into compliant label layouts, reliably being printed and applied wherever needed across your production environment.

A software like never before

-  **Manage & control the most complex product identification processes**
-  **Guarantee product identification performance**
-  **Achieve traceability & transparency**
-  **Adapt flexibly to process & regulatory changes**
-  **Orchestrate data, layout and print in one integrated workflow**
-  **Customize through simple configuration**
-  **Connect all printers – independent from brand & technology**

Get things done. Know what's going on.

PID 3SIXTY combines print & data management and label design to support your product identification processes end-to-end. With manage.ID, the software bridges the gap between IT & production and ensures that the right data is sent to the right printing devices at the right time.

With design.ID, you get a user-friendly entry-level label design software that can either be used standalone for pure label design or in combination with manage.ID to cover the complete product identification process.

manage.ID

Product identification is something not everyone likes to do, but it is absolutely necessary. This process requires the interaction of data, layouts and production devices. manage.ID is able to connect these three interfaces while ensuring consistent and compliant product labeling throughout the production line. As a brand and technology-independent software, manage.ID offers maximum flexibility for the customer.

manage.ID in the IT world

manage.ID centralizes and maintains all data related to product identification in a centralized database. The software gathers data from the customer's IT environment, such as an ERP/MES system or a designated database, consolidates it, and distributes it to all devices linked to the identification process.

manage.ID in production environments

An efficient line control system can improve quality, reduce costs, and distributes it to all devices linked to the identification process. manage.ID automates coding and printing processes to minimize inaccuracies, ensure consistency and compliance, and increase efficiency in every phase of the identification process. With drag-and-drop functionality and a wide range of widgets, the software is particularly user-friendly and can be adapted easily to the specific needs of the customer.

design.ID

Create professional packaging and logistics labels with a smart, simple label design software that puts you in control. Featuring an intuitive WYSIWYG editor with full 1D and 2D barcode support, design.ID enables reliable label creation and seamless hardware integration – from product to pallet identification.

As a user-friendly, entry-level label design software, design.ID can be used standalone for pure label design or combined with manage.ID to create a powerful solution for your complete product identification processes. With quick installation, secure on-premises deployment and a one-time license instead of recurring subscriptions, design.ID ensures flexibility, scalability and full control over your label workflows.

For more connectivity in your product identification process

manage.ID bridges the gap between IT & production, enterprise systems & machines as well as data & processes and ensures that the right data is sent to the right printing devices at the right time. To do this, it collects the data coming from the customer's IT landscape, be it an ERP or MES system or a dedicated database, bundles it and sends it to all relevant product identification devices.

Maximum user-friendliness

Intuitive and user-friendly interfaces can significantly increase productivity and efficiency in various areas. In manage.ID, users can adapt many workflows to their individual needs by simply dragging and dropping:

- Widgets:** By dragging and dropping, the users can move their required widgets back and forth on the dashboard as they need them.
- Production start:** The users can start a production by dragging and dropping a product order into a production line.
- Coding scenarios:** The users can create a coding scenario (= specific sequence of steps in his identification process) by dragging and dropping these actions one after another.

All-in-one solution for product identification

- Independence:** manage.ID is brand and technology independent and therefore speaks all printer languages, which means the users can interconnect any product identification device along the entire production line.
- Central management:** manage.ID enables the management of all product identification tasks in one central location.

Preconfigured scenarios: Preconfigured coding scenarios for a wide range of identification challenges make the orchestration of the entire product identification process simple and fool proof.

Benefit from our fast deployment speed

With manage.ID you are ready to go in no time at all. No or low-code & brand- & technology-independent integrations ensure a fast deployment.

- Easy set-up of production sites, lines and devices
- Create your own dashboard through user-specific widget selection
- Define & automate your identification process through simple configuration
- No code/low-code implementation
- Web-based: one installation to serve all users

Product compliance

manage.ID not only guarantees overall transparency throughout the entire product identification process, it also helps you stay compliant with policies, laws, and corporate/industry standards and thus protects your brand and supports in avoiding potential fines or legal issues.

- Compliant with IT standards
- Regulatory compliance (e.g. GS1)
- Ensure (printing) traceability
- Overall transparency throughout the entire product identification process

Manage your product identification data

- Bi-directional data flow:** A central hub for all data streams with bi-directional data flow puts you in complete control.
- Corporate system interface:** manage.ID acts as an interface between most common enterprise systems (ERP, MES, WMS...) and the production devices to retrieve all relevant data required to cover the product identification process.
- Database independence:** manage.ID has its own database for maximum independence and flexibility.
- Data editing:** manage.ID offers the possibility to maintain and change all data within the system.

Bridging IT and production

manage.ID collects and bundles the data coming from the customer's IT landscape and sends it to all relevant product identification devices.

Our premade solution packages

manage.ID Connect
manage.ID seamlessly translates data from corporate systems (such as ERP/MES) into print jobs to start the product identification process – regardless of the coding processes, brands or technologies that are in use. **manage.ID Connect makes your corporate system print!**

manage.ID Sync
manage.ID synchronises data, layouts and/or print jobs with compatible hardware on which the machine operators can initiate the product identification process. The use of correct data & layouts is guaranteed while the machine operators continue to use their trusted hardware user interface. **manage.ID Sync makes your product identification hardware smart!**

manage.ID Select
manage.ID offers a comprehensive widget-based user interface where shopfloor users can initiate production. Widgets and production interfaces are designed on data selection which are combined with data-driven calculations & decisions to avoid human errors and increase efficiency. **manage.ID Select puts the operator in full control of the identification process!**

manage.ID Control
manage.ID tracks and identifies the logistic units during the production process and is making sure the product identification process is being executed at the right time with the right data. It focuses on the pallet labelling process and is tailored to work with compatible PID hardware assuring full compliance with pallet labelling regulations. **manage.ID Control makes your data & hardware a perfect match!**

It's everything you need for professional labels

design.ID is a user-friendly entry-level label design software from PID Software Solutions. It can be used standalone for pure label design or combined with the print data management software manage.ID to create a powerful solution for your complete product identification processes.

Your benefits at a glance

- ✓ Reliable label design software for packaging and logistics labels
- ✓ WYSIWYG editor with 1D & 2D barcode support
- ✓ Secure on-premises solution
- ✓ Native support for all PID printers and most third-party printers
- ✓ Quick installation and ready to use immediately

Why you should choose design.ID?

- ✓ **End expensive subscriptions**
One-time license fee instead of recurring costs. With design.ID, you pay once and use the software indefinitely.
- ✓ **Easy to use**
Anyone can design labels in minutes - no IT support needed. Professional label design has never been easier.
- ✓ **Scalable without additional costs**
Ensures that the right data in the right format is used on the right device on the right production line at the right time.
- ✓ **Seamless hardware integration**
Native support for all NOVEXX Solutions, EIDOS, and Logopak printers plus comprehensive third-party compatibility and Windows driver support.

What PID 3SIXTY will do for you

Data handling
Connects different data sources to one source and uses it for the identification process.

Print process control
Ensures that the right data in the right format is used on the right device on the right production line at the right time.

Product compliance
Generates, manages and controls unique identifiers (e.g. SSCC) and other required calculations (expiry date, batch numbers, ...).

Track & Trace
Provides full print traceability with the ability to export to other IT systems.

Structuring the identification process
Manages and controls identification-related processes and tasks through specific user roles, workflows and coding scenarios.

Label design
Use design.ID as a user-friendly entry-level label design software – standalone for pure label design or combined with manage.ID to cover the complete product identification process.

We offer solutions for

Quality Control

The software **captures all data directly at the source**, is able to **link all product identification devices on the production line**, and ensures that **all relevant information**, such as expiration date or batch number, is **identical on all product levels**.

Data Management

manage.ID **bundles all the data required for product identification** (product and production data) **coming from a wide variety of systems into a single source of truth and makes them available for printing**. During the printing process, the software then connects the correct data to the correct layout.

Integration

Integrating product identification into existing production environments requires many parties and interfaces. With manage.ID, we bring **structure to this complex process and advise companies** on how to integrate product identification most efficiently.

Traceability & Aggregation

manage.ID is able to **link the primary, secondary, and tertiary product packaging layers for total transparency and traceability** throughout production. We help the customer to track ongoing production and enable traceability of previous production batches.

The PID 3SIXTY creators

11 strong partner companies, 1.000 international product identification experts, 1 common goal: helping customers with their product identification challenges.

We, the PID Software Solutions Team, emerged from PID Group, where we have gained decades of experience in product identification in a wide range of industries and use cases. Our knowledge of the product identification process is unrivaled, and we have pooled our resources to create the most dedicated team focused exclusively on developing the most advanced, efficient, and user-friendly product identification software matching the market needs.
